# Problem Statement

*"Cavity optomechanics", Aspelmeyer et al. 2014*

*Quantum Optomechanics, Bowen et al. 2015*

# Hamiltonian

Optical Cavity  $\hat{a}$ ,  $\omega_o(\hat{x}_{\text{mech}}) = \omega_o + \frac{g}{\omega_o} \hat{x}_{\text{mech}}$ ; mechanical oscillations  $\hat{b}$ ,  $\omega_m$ ; coupling  $g$ ; Drive  $E$ ,  $\omega_L$

$$H = \underbrace{\omega_o a^\dagger a}_{\text{Cavity}} + \underbrace{\omega_m b^\dagger b}_{\text{Mechanical}} - \underbrace{g a^\dagger a (b + b^\dagger)}_{\text{Interaction}} + \underbrace{E(ae^{i\omega_L t} + a^\dagger e^{-i\omega_L t})}_{\text{Drive}}$$

*Rotating Wave Approximation* at  $\omega_L$  with  $\Delta = \omega_o - \omega_L$ ,  $a \rightarrow ae^{i\omega_L t}$ :

$$H_{\text{RWA}} = \Delta a^\dagger a + \omega_m b^\dagger b - g a^\dagger a (b^\dagger + b) + E(a + a^\dagger)$$

$$\hbar = 1$$

*Quantum Optomechanics*, Bowen et al. 2015 (2.3)

*QuantumOptics.jl*, Krämer et al. 2024 (Optomechanical Cavity)

# Hamiltonian Linearization

$$H_{\text{RWA}} = \Delta a^\dagger a + \omega_m b^\dagger b - g a^\dagger a (b^\dagger + b) + E(a + a^\dagger)$$

Linearize  $a = \alpha + \delta a$ ,  $b = \beta + \delta b$ ; with  $\alpha, \beta$  steady state.

$$\begin{aligned} H_{\text{Interaction}} &= -g a^\dagger a (b^\dagger + b) \\ &\approx -\underbrace{g|\alpha|}_G (\delta a + \delta a^\dagger + \mathcal{O}(a^2 + \delta a \delta a^\dagger)) (\delta b + \delta b^\dagger + 2\beta) \end{aligned}$$

Therefore for small  $G$ :

$$\begin{aligned} H &\approx \Delta \delta a^\dagger \delta a + \omega_m \delta b^\dagger \delta b - G(\delta a + \delta a^\dagger)(\delta b + \delta b^\dagger) + E(a + a^\dagger) \\ &\sim \frac{\Delta}{2}(\hat{X}^2 + \hat{Y}^2) + \frac{\omega}{2}(\hat{Q}^2 + \hat{P}^2) - G\hat{X}\hat{Q} + E\hat{X} \end{aligned}$$

# Dissipation

Optical decay  $\kappa$ :

$$L_O = \sqrt{\kappa} \delta a$$

Mechanical resonator with  $\gamma$  and a thermal bath at the  $n$ -th thermal state:

$$L_M = \sqrt{\gamma(n+1)} \delta b + \sqrt{\gamma n} \delta b^\dagger$$

# Implementation

truncated Fock Basis:  $F_{\text{optical}} \otimes F_{\text{mechanical}}$

definition of  $H, J$  with  $\delta a \otimes 1$

$$\psi(0) = |0\rangle \otimes |0\rangle$$

Time Evolution using the *Lindblad equation*:

$$\dot{\rho} = -i[H, \rho] + J\rho J^\dagger - \frac{1}{2}\{J^\dagger J, \rho\}$$

## Time evolution of $n$

# Continuous measurement

Lindblad Master Equation:

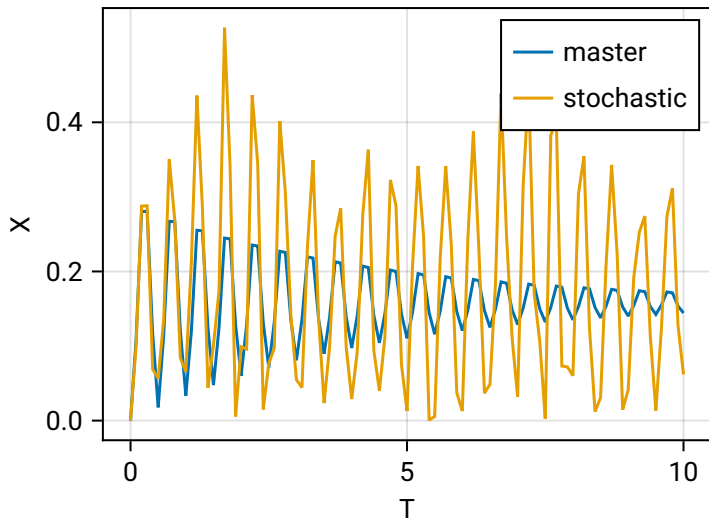

$$\dot{\rho} = -i[H, \rho] + J\rho J^\dagger - \frac{1}{2}\{J^\dagger J, \rho\}$$

Stochastic Master Equation:

$$\dot{\rho} = -i[H, \rho] + J\rho J^\dagger - \frac{1}{2}\{J^\dagger J, \rho\} + (C\rho + \rho C^\dagger - \text{Tr}(C\rho + \rho C^\dagger)) \xi(t)$$

Let's look at the Quadrature  $C = \eta\sqrt{\kappa} (\delta a + \delta a^\dagger)$

Took  $\approx 1$  min of compute time. Why is the SME so much slower? True Random Values?

# Expectation

$$S_x = S_x^{\text{imp}} + S_x^{\text{ba}} + S_x^{\text{zpf}}$$

$S_x^{\text{imp}} \propto P^{-1} \omega^0$ : Imprecision / Shot noise

$S_x^{\text{ba}} \propto P$ : Back action

$S_x^{\text{zpf}}$ : Zero Point Fluctuation

*"Nanomechanical motion measured with an imprecision below that at the standard quantum limit", Teufel et al. 2009 (Fig. 1)*

# Understanding $S_{\text{det}}(\omega, P_{\text{in}})$

Where is the power dependence?

$$\bar{S}_{\text{det}}(\omega) = \frac{1}{8\eta\Gamma|C_{\text{eff}}|} + 2\Gamma|\chi(\omega)|^2|C_{\text{eff}}|$$

$$C_{\text{eff}}(\omega) = \frac{4g^2}{\kappa\Gamma(1-2i\omega/\kappa)^2}$$

$$\chi(\omega) = \frac{\Omega}{\Omega^2 - \omega^2 - i\omega\gamma}$$

$\eta$ : Detection efficiency

$\Gamma = \gamma$ : Damping of oscillator

$$\bar{S}_{\text{det}}(\omega) = \frac{\kappa\Gamma|1-2i\omega/\kappa|}{8\eta\Gamma 4g^2} + 2\Gamma \frac{\Omega^2}{|\Omega^2 - \omega^2 - i\omega\gamma|^2} \frac{4g^2}{\kappa\Gamma(1-2i\omega/\kappa)^2}$$

Quantum Optomechanics, Bowen et al. 2015 (eq. 3.51)

$$P/P^{\text{SQL}} = \{0.1, 0.4, 1, 4, 10\}$$

Quantum Optomechanics, Bowen et al. 2015 (Fig. 3.5)

Looking for a source that derives  $S_{\text{det}}(\omega, P)$ ?  
Or even states  $S_{\text{det}}(\omega, P)$ .

## Or, selecting a simpler system?

**Fig. 8.4** Detection of a classical force by monitoring the coordinate of an oscillator on which it acts.

Not simulating the detector, just the oscillator and adding the Backaction in the measurement operator ...
